## **Executive Summary**

### **As of June 30, 2018**

**The value of the City of San Jose Police and Fire Department Retirement Plan Health Care Trust's assets was \$119.0 million on June 30, 2018, a decrease of \$6.7 million from the end of the prior quarter. The Trust had \$7.2 million in net cash outflows for the quarter.**

- The Health Care Trust's net of fees performance was +0.3% for the quarter, underperforming the Policy Benchmark of +1.4% and the Allocation Index return of +1.1%. Over the one-year period the Trust returned +3.6%, underperforming both the Policy Benchmark (+7.4%) and Allocation Index (+4.8%).
  - Underperformance vs. the Policy Benchmark was primarily attributable to active GTAA manager underperformance.
- The Health Care Trust's Total Global Fixed Income allocation ended the quarter just outside of its target range (27.8% vs. target range of 5.0 – 25.0%) and the Cash allocation ended the quarter outside of its target range (8.3% vs. target range of 0.0 – 5.0%).
- Performance was mixed in the quarter and one-year periods at the broad asset class level.
  - Global Equity returned +0.4% for the quarter and +11.1% over the one-year period, underperforming the MSCI ACWI IMI benchmark's quarterly return of +0.7% for the quarter and in-line over the one-year period.
  - Global Fixed Income returned -0.2% for the quarter and -0.4% over the one-year period, in-line with the BBgBarc US Aggregate in both periods.
  - Real Assets returned +4.8% for the quarter and +4.9% over the one-year period, underperforming the Real Assets Custom Benchmark return by 50 and 30 basis points in both periods, respectively. For the quarter, Credit Suisse (+1.6%) outperformed the Bloomberg Commodities Index (+0.4%), Vanguard REIT (+8.8%) underperformed its Custom Benchmark (+9.7%), and Rhumblin Brookfield Global Infrastructure (+4.3%) outperformed the DJ Brookfield Global Infrastructure Net TR USD (+4.2%).
  - GTAA returned -2.6% for the quarter, underperforming the 60% MSCI World/40% Citi WGBI by 230 basis points. For the quarter, GMO Benchmark Free Allocation (-2.3%) and PIMCO All Asset All Authority (-3.2%) both underperformed their benchmarks.
- There will be a discussion of the Health Care Trust's asset allocation at the August Investment Committee meeting.

## Second Quarter Manager Summary

Investment Manager	Asset Class	Changes/ Announcements	Performance Concerns	Meketa Recommendation <sup>1</sup>	Comments
Credit Suisse Risk Parity	Commodities	---	---	---	---
GMO Benchmark Free Allocation Fund	GTAA	---	---	GTAA Class Eliminated	---
PIMCO All Asset All Authority	GTAA	---	---	GTAA Class Eliminated	---

<sup>1</sup> The Meketa Investment Group recommendations are based on organizational or resource changes at each manager.

**Watch List<sup>1</sup>**

Investment Manager	Asset Class	Watch List Status	Comments
GMO Benchmark Free Allocation Fund	GTAA	---	Underperformance
PIMCO All Asset All Authority	GTAA	---	Underperformance

<sup>1</sup> Watch List excludes Private Markets Funds.

## **Glossary and Notes**

**Credit Risk:** Refers to the risk that the issuer of a fixed income security may default (i.e., the issuer will be unable to make timely principal and/or interest payments on the security.)

**Duration:** Measure of the sensitivity of the price of a bond to a change in its yield to maturity. Duration summarizes, in a single number, the characteristics that cause bond prices to change in response to a change in interest rates. For example, the price of a bond with a duration of three years will rise by approximately 3% for each 1% decrease in its yield to maturity. Conversely, the price will decrease 3% for each 1% increase in the bond's yield. Price changes for two different bonds can be compared using duration. A bond with a duration of six years will exhibit twice the percentage price change of a bond with a three-year duration. The actual calculation of a bond's duration is somewhat complicated, but the idea behind the calculation is straightforward. The first step is to measure the time interval until receipt for each cash flow (coupon and principal payments) from a bond. The second step is to compute a weighted average of these time intervals. Each time interval is measured by the present value of that cash flow. This weighted average is the duration of the bond measured in years.

**Information Ratio:** This statistic is a measure of the consistency of a portfolio's performance relative to a benchmark. It is calculated by subtracting the benchmark return from the portfolio return (excess return), and dividing the resulting excess return by the standard deviation (volatility) of this excess return. A positive information ratio indicates outperformance versus the benchmark, and the higher the information ratio, the more consistent the outperformance.

**Jensen's Alpha:** A measure of the average return of a portfolio or investment in excess of what is predicted by its beta or "market" risk.  $\text{Portfolio Return} - [\text{Risk Free Rate} + \text{Beta} * (\text{market return} - \text{Risk Free Rate})]$ .

**Market Capitalization:** For a firm, market capitalization is the total market value of outstanding common stock. For a portfolio, market capitalization is the sum of the capitalization of each company weighted by the ratio of holdings in that company to total portfolio holdings; thus it is a weighted-average capitalization. Meketa Investment Group considers the largest 65% of the broad domestic equity market as large capitalization, the next 25% of the market as medium capitalization, and the smallest 10% of stocks as small capitalization.

**Market Weighted:** Stocks in many indices are weighted based on the total market capitalization of the issue. Thus, the individual returns of higher market-capitalization issues will more heavily influence an index's return than the returns of the smaller market-capitalization issues in the index.

**Maturity:** The date on which a loan, bond, mortgage, or other debt/security becomes due and is to be paid off.

**Prepayment Risk:** The risk that prepayments will increase (homeowners will prepay all or part of their mortgage) when mortgage interest rates decline; hence, investors' monies will be returned to them in a lower interest rate environment. Also, the risk that prepayments will slow down when mortgage interest rates rise; hence, investors will not have as much money as previously anticipated in a higher interest rate environment. A prepayment is any payment in excess of the scheduled mortgage payment.

**Price-Book Value (P/B) Ratio:** The current market price of a stock divided by its book value per share. Meketa Investment Group calculates P/B as the current price divided by Compustat's quarterly common equity. Common equity includes common stock, capital surplus, retained earnings, and treasury stock adjusted for both common and nonredeemable preferred stock. Similar to high P/E stocks, stocks with high P/B's tend to be riskier investments.

**Price-Earnings (P/E) Ratio:** A stock's market price divided by its current or estimated future earnings. Lower P/E ratios often characterize stocks in low growth or mature industries, stocks in groups that have fallen out of favor, or stocks of established blue chip companies with long records of stable earnings and regular dividends. Sometimes a company that has good fundamentals may be viewed unfavorably by the market if it is an industry that is temporarily out of favor. Or a business may have experienced financial problems causing investors to be skeptical about its future. Either of these situations would result in lower relative P/E ratios. Some stocks exhibit above-average sales and earnings growth or expectations for above average growth. Consequently, investors are willing to pay more for these companies' earnings, which results in elevated P/E ratios. In other words, investors will pay more for shares of companies whose profits, in their opinion, are expected to increase faster than average. Because future events are in no way assured, high P/E stocks tend to be riskier and more volatile investments. Meketa Investment Group calculates P/E as the current price divided by the I/B/E/S consensus of twelve-month forecast earnings per share.

**Quality Rating:** The rank assigned a security by such rating services as Fitch, Moody's, and Standard & Poor's. The rating may be determined by such factors as (1) the likelihood of fulfillment of dividend, income, and principal payment of obligations; (2) the nature and provisions of the issue; and (3) the security's relative position in the event of liquidation of the company. Bonds assigned the top four grades (AAA, AA, A, BBB) are considered investment grade because they are eligible bank investments as determined by the controller of the currency.

**Sharpe Ratio:** A commonly used measure of risk-adjusted return. It is calculated by subtracting the risk free return (usually three-month Treasury bill) from the portfolio return and dividing the resulting excess return by the portfolio's total risk level (standard deviation). The result is a measure of return per unit of total risk taken. The higher the Sharpe ratio, the better the fund's historical risk adjusted performance.

**Standard Deviation:** A measure of the total risk of an asset or a portfolio. Standard deviation measures the dispersion of a set of numbers around a central point (e.g., the average return). If the standard deviation is small, the distribution is concentrated within a narrow range of values. For a normal distribution, about two thirds of the observations will fall within one standard deviation of the mean, and 95% of the observations will fall within two standard deviations of the mean.

**STIF Account:** Short-term investment fund at a custodian bank that invests in cash-equivalent instruments. It is generally used to safely invest the excess cash held by portfolio managers.

**Style:** The description of the type of approach and strategy utilized by an investment manager to manage funds. For example, the style for equities is determined by portfolio characteristics such as price-to-book value, price-to-earnings ratio, and dividend yield. Equity styles include growth, value, and core.

**Yield to Maturity:** The yield, or return, provided by a bond to its maturity date; determined by a mathematical process, usually requiring the use of a “basis book.” For example, a 5% bond pays \$5 a year interest on each \$100 par value. To figure its current yield, divide \$5 by \$95—the market price of the bond—and you get 5.26%. Assume that the same bond is due to mature in five years. On the maturity date, the issuer is pledged to pay \$100 for the bond that can be bought now for \$95. In other words, the bond is selling at a discount of 5% below par value. To figure yield to maturity, a simple and approximate method is to divide 5% by the five years to maturity, which equals 1% pro rata yearly. Add that 1% to the 5.26% current yield, and the yield to maturity is roughly 6.26%.

$$\frac{5\% \text{ (discount)}}{5 \text{ (yrs. to maturity)}} = 1\% \text{ pro rata, plus } 5.26\% \text{ (current yield)} = 6.26\% \text{ (yield to maturity)}$$
